

2.9 Industry, Innovation and Infrastructure (SDG 9)

Imam Ja'afar Al-Sadiq University greatly supports scientific research that aims to address the daily problems that the residents of the region suffer from. The university has adopted a policy of rewarding financial rewards to encourage scientific staff to research and enhance the production process within the university.

The projects developed by our students and researchers within the university turn into social benefits through their implementation in the areas needed by society, within the scope of cooperation between the university and industry in partnership with official institutions and non-profit institutions. There is also a special section in each college for extra-curricular student activities, where a number of willing and interested students are selected from all scientific departments to carry out volunteer work within the university. In the field of infrastructure, smart solar mobile chargers were provided by the Zain phone company to be installed at Imam Ja'afar Al-Sadiq University. This street charging unit has been installed at different places on campus to grant free phone charging services to 4 students simultaneously. The charging unit runs entirely on solar panels that have already been exposed to solar energy and work for (24) hours. Finally, university researchers have developed and put into action a number of projects where the energy is produced using installed Solar Panels. The work is ongoing to employ these projects in real applications at the university.
