

2.11 Sustainable Cities and Communities (SDG 11)

Imam Ja'afar Al-Sadiq University has made it a policy to convert all of its buildings into sustainable structures that rely on natural illumination from sunshine and enable fresh air to circulate through all of the buildings' corridors. Furthermore, a system was developed to use water ideally in each building by using water taps that rely on the principle of irregular water pumping or in the form of a sprayer, and the plant irrigation system is used around each building using drip irrigation technology. The buildings also rely on a high percentage of energy self-sufficiency using solar cells with using technology for lighting.
